# Myriad UnderwritingCenter®
from CoreLogic®

The Future of Underwriting Automation and Intelligence is Here

With the Myriad UnderwritingCenter® solution, CoreLogic continues on our vision towards *Making Property As Easy As Auto®*. Rich property, eligibility, and hazard data now seamlessly integrates with the industry's leading underwriting workbench to deliver the property risk content you want and the automated workflow you need to transform, simplify and modernize underwriting across your entire enterprise.

Create Enterprise Agility

The easy-to-use platform centralizes actionable intelligence from all points of the property insurance lifecycle including underwriting, agency, direct-to-consumer and claims. The self-learning model then incorporates results back into the decision models that are powered by our rich property risk data.

With the UnderwritingCenter, you get an underwriting workbench that is easy to use, enables enterprise agility and even improves the agent and homeowner experience. With limited IT investment, the end-to-end solution could automate your underwriting and rules-based decisions to deliver a consistent, straight-through and efficient process in about 90 days.

Myriad UnderwritingCenter streamlines the underwriting process and helps your organization to improve efficiency, risk management, and the overall agent and homeowner experience.

A Proven Decisioning Solution

Top carriers consider hundreds and even thousands of new policies each day. The underwriters reviewing these policies face challenges in their attempt to make timely decisions on policies by leveraging multiple third party and public record sites and hazard maps; a challenge for even the most experienced underwriter. Often, a survey inspection is ordered to further mitigate risk and ensure the policy is priced correctly. Because of time restraints, scattered and inaccurate data, and survey management challenges, a risky policy may sometimes be issued or underpriced while surveys may unnecessarily be ordered on clean policies.

The UnderwritingCenter eliminates most of this risk by automating the underwriting workflow within a single software platform to deliver more data-driven insights and consistency in underwriting decisioning throughout your organization.

Optimize Survey Programs

Although physical surveys are a critical tool that carriers use to price and manage risk, they are expensive and managing the process within the regulated "free period" can be challenging.

The UnderwritingCenter uses three layers of property risk content and your pre-set rules to automate survey recommendations and reduce the number of physical surveys ordered that may not be needed. Intelligence such as occupancy of the property, it's reconstruction cost as well as the property's natural hazard risk is integrated and maintained within the decisioning models. If a physical survey is still recommended, the platform will order a survey from one of over 60 vendors and manage and standardize the process for you.

Real-time, Low Cost Alternatives to a Physical Survey

In most instances, the platform recommends a real-time, low cost alternative to a physical survey—at about a third of the cost.

The UnderwritingCenter's virtual survey allows the underwriter to view interactive high-resolution exterior imagery, compare and resolve ITV results, confirm property characteristics and understand hazard risk.

A third alternative puts the homeowner in control. Via a mobile application, the homeowner can use their smart phone to take pictures and submit a DIY survey. The application can even be private labeled and ported into your existing application.

Collaboration and Participation

Adding value to the agent and homeowner experience is important to today's property insurer. Unlike legacy underwriting systems, the UnderwritingCenter eliminates inefficient communication practices by giving functional access to agents, homeowners, and claims adjustors.

Intelligence and Analytics

Think of the UnderwritingCenter as your underwriting data warehouse—rich property, eligibility and hazard content that never gets lost and in fact, gets integrated into state-of-the-art machine learning so that year-over-year, your results continue to improve. The platform not only streamlines the underwriting process, but also provides insight into every decision made by your underwriters via reports and analytics that can be used across your organization to improve efficiency, risk management, and the overall agent and homeowner experience.
